This course will take an in-depth approach to some of the most important studies in the history of psychology. This approach will allow us to explore some key scientific underpinnings of the field, while also investigating some of the important controversies about the human psychological experience. Consistent with the emphasis on the science of psychology, students will work in teams to collect data and replicate a famous study of social influence. Because psychology is an immensely broad discipline, our explorations will span a variety of topics including the psychological aspects of the brain, development, learning, social interactions, and psychopathology.
